ö
to perform PCR on cells present in histochemical sections or cytochemical smears, e.g. for biological, forensic or pathological studies. The primer was one of a pair used to amplify papillomavirus DNA from human cervical cancer cells SiHa. A 449 bp PCR prod. was obtd. by this method whereas multiple primer pairs were needed for the same result using conventional PCR methods. See also AAQ34980-6. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cpds. N4-(1-4C alkyl) cytidine 5'-triphosphate (I) and N4-(1-4C alkyl)-2'-deoxycytidine 5'-triphosphate (II) are new. (I) and (II) serve as substrates for RA and DNA polymerases for incorporation of the N4-(1-4C alkyl)-cytosine moiety into oligo- and polymucleotides. They can be used in DNA sequence analysis, primer extension reactions and nucleic acid amplification. To assess the potential for using N4-methyl-dCTP in PCR amplification, reaction mixts. cong. the canonical nucleotide set were compared to mixts in which dCTP was replaced by the N4- methyl-tytosine analogue, in a PCR experiment designed to amplify a 293 bp sequence of HPV16 DNA. Using a high-temp. regimen the desired fragment was obtained regimen, conducted with AdTP or with N4-methyl-dCTP, A low-temp. regimen, conducted with dCTP or with N4-methyl-dCTP, A low-temp. mixt., cleanly produced identical amts. of the expected fragment as the sole amplification product. pigment epithelium-derived factor (PEDF) has both neuronotrophic and gliastatic activity, making it useful in cases where neurons die quickly and glia tend to proliferate (gliosis), e.g. in CNS cell culture, in neurodegenerative diseases and in CNS injury. The neuronotrophic effect of PEDF is especially useful for enhancing survival of neuronal cell cultures intended for use in transplantation. These include cultures of human foetal brain cells and neural retina and photoreceptor cells. The gliastatic activity of PEDF can be applied to inhibiting glial cell cused for inhibiting PEDF can be used for inhibiting PEDF can be used for inhibiting PEDF can immunoassay for determining levels of PEDF in fluid, cellular or tissue samples e.g for determining againg and/or other degenerative diseases. Eight primers (AAT11661-68) were synthesised base on the cDNA sequence of PEDF and used to amplify fragments of the PEDF gene for later sequencing. Two primers (AAT11661, AAT11662) were used to amplify a 2 kilobase fragment from exon 3 to exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Neo-specific primer P8, (AAT78982), primer P586 (AAT78983) derived from exon 5 of the mouse Huntington's disease (HD) gene (see AAT78974), and primer P9 (AAT78984) derived from intron 5 of the gene were used in the genotype analysis of heterozygous transgenic mice embryos carrying a targeted mutation in exon 5. The results indicated that loss of function of the endogenous Hdh gene resulted in embryonic lethality during early post-implantation development. Transgenic mice can be used as models of HD
                                                                                                                                                                             Mouse Huntington's Disease gene - useful for generating transgenic mice as a model of Huntington's Disease.

Universal primer used for multiplex DNA amplification - allows simultaneous amplification of multiple DNA target sequences for high through-put genetic screening.

Claim 8; Page 10; 38pp; English.

AAT47345-T47374 represent variants of a universal primer sequence (see AAT47344) derived from the bacteriophage vector Ml3mpl8. This sequence can be used as half of the DNA primer of the invention. The primers are used for amplification of a target DNA sequence, and can be used in a multiplex PCR amplification. The primers have the sequence 5'-XY-3', where X is a sequence that does not hybridise to the target sequence (such as this sequence), and Y is a sequence contained within or flanking the target sequence. The melting temperature of a hybrid between X and its complement (in the absence of other sequences) is 60 degrees C. During early cycles of amplification, products are synthesised that contain the chimeric primers on either end. The primers then serve as high stringency recognition sequences for subsequent rounds of

ŏ amplification. As a result, the annealing efficiency of different primers and their targets in a multiplex amplification reaction is normalised, thereby reducing preferential amplification of certain targets. The chimeric primer comprises a 5' universal domain and a 3' target-specific domain. They are used for the simultaneous PCR amplification of multiple DNA targets in a sample. The primer containing AAT47344 is particularly useful in high-throughput genetic screening for detecting the presence of multiple defined targets e.g. to detect mutations in genes like the cystic fibrosis transmembrane conductance regulator (CFTR), the Wilms Tumour, and the beta-thalassaemia genes

Isolated protein with puromycin-sensitive aminopeptidase activity - which may be used in treatment of proliferative disorders, including cancer and psoriasis.

Claim 36; Page 109; 141pp; English.

This antisense oligonuclectide is specifically hybridisable with selected DNA or RNA deriving from the puromycin-sensitive aminopeptidase (PSA)-99. This oligonuclectide is used for dignosing conditions associated with PSA expression. The human PSA-99 (875 amino acids) and the murine PSA-99 (970 amino acids) both exhibit PSA activity and can be used to generate anti-PSA artibodies. Cell lines which produce the antibody and host cells transfected with vector containing nucleic acid molecules encoding the PSA and the oligonuclectides can be used in assays for identification of agents which act by targeting PSA, for modulating PSA activity or agents which act by targeting PSA, for modulating PSA activity of endogenous PSA substrates, proliferation rate or viability of cells or induce apoptosis within cells by inhibiting PSA activity. Agents which induce apoptosis within cells by inhibiting PSA activity. Agents which can diminish PSA activity in cells we modulation of the amount of PSA in cells due to modulation of PSA synthesis, may be used in treatment of proliferative diseases, including tumours such as leukaemias and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences shown in AAV33257 to AAV33263 represent primers used for the PCR amplification of the human papillomavirus (HPV) type 16 genome contained in the human cervical cancer cell line SiHa. The invention provides a thermal cycler sample compartment optimised for holding and controlling he temperature of one or more microscopes which facilitates thermal cycling. It also contains a device (barrier) for protecting a microscope slide from fluid or vapour when the slide is sealed in the device, comprising a plastics material that has high thermal in the device, computivity, and is imperious to fluid or vapour, and is dimensioned so as to receive the slide. The new thermal cycling compartment is useful for performing in situ PCR for detection of target nucleic acid sequences directly from cells fixed onto a microscope slide, used in the field of cell biology, forensic science and clinical, veterinary and plant pathology. The modified heat blocks increase the speed and reliability of in situ PCR performed on microscope slides by accelerating and rendering more uniform the heat transfer which occurs during thermal cycling.
                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes LRPS (low density lipoprotein (LDL)) receptor related protein, previously designated LRP-3). Nucleic acid molecules (NAMS) encoding LRPS can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRPS may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contemination, elevation of free faity acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's diseases and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening. AAV889917 to AAV86012 represent PCR primers for obtaining LRP-3 CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LRP5; LDL-receptor related protein; LRP-3; IDDM; diagnosis; endocytosis; insulin dependent diabetes mellitus; autoimmune disease; glomerulonephritis; inflammation; viral infection; osteoporosis; hypercholesterolemia; Alzheimer's disease; low density lipoprotein; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The primers AAV43732-V43776 were to produce cancer associated gene fragments which can be used to detect cancer cells in tissue samples or biological fluids. They are detected by monitoring the change in mRNA expression as compared to normal tissue of one or more cancer-associated genes whose cDNA stringently hybridises to the nucleic acid fragments. The change in expression may be an increase or a decrease compared to normal tissue. The mRNA expression may be determined by PCR, Northern blotting or ribonuclease protection assay, or by determining the change in the amount of protein encoded by the gene(s) as compared to normal tissue, for example by using a labelled antibody recognising the protein. Detection of cancer cells for cancer diagnosis, including detection of metastatic cancer cells in tissues other than the primary tumour site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of cancer cells in tissue samples - by changes in mRNA expression compared to normal tissue of specific cancer-associated gene

Sequences shown in AAV54677 to AAV54683 represent primers used for the PCR amplification of the Human papillomavirus (HPV) gene contained in the human cervical cancer cell line SiHa. These are used in the course of the invention which provides a thermal cycling device comprising a ceramic sample plate supporting a ceramic sample plate supporting a flat thermally coupled to the plate ample and a thermal sensor, a heater thermally coupled to the plate ample and a colorer for the substrate. The device atther maintains the temperature of the sample or subjects it to thermal cycling. The thin ceramic plate permits very rapid heat transfer to a sample on a microscope slide and this thermal cycling devise can be used for PCR amplification or hybridisation of target nucleic acid on microscope slide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

```
New nucleic acid encoding human cyclin-dependent kinase-10 - used e.g. to identify modulators of cell cycle progression for treating cancer or immune cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a vector for plant transformation, comprising a TT-DNA with flanking T-DNA borders and also a polynucleotide that prevents the development of plant transformants containing more vector sequences than the T-DNA sequence. The vectors encode toxins that are specific to
                                                                                                                                                                                                                         Gene-specific primer PK22L234 and adapter primer API (see AAV32935) were used in a RACE PCR technique for cloning a 5' coding region of novel human cyclin-dependent Kinase 10 (CDX10) cDNA, using adapter-ligated human placenta cDNA as template. Nested primers (see AAV32936-37) were used in a second PCR, to produce an approximately 600 bp product. A 3' fragment was identified by database search, and a full-length sequence (see AAV32932) was produced in vector pLITMUS28:CDK10. The CDK10 protein product (see AAW3903) is used 6.g. to identify modulators of cell cycle progression and for treating cancer or immune cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New vector for plant transformation - useful for producing toxins that are specific to certain plants, or those which act on membrane systems and/or other cellular structures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plant transformation, T-DNA, toxin; transgenic; transgenic food;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       AAV69978 to AAV69988 represent antisense oligonuclectides which are specifically hybridiaable with a region of a nucleic acid encoding human c-Jun protein. The antisense compound regulates the expression of the c-Jun protein. The present invention also describes antisense oligonuclectides which regulate the c-Fos protein. The antisense oligonuclectides which requisite the c-Fos protein. The antisense and isociated with Activating Protein lexpression, of which accompositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos and in calls or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease
                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.

cellular structures. Examples of genes include those encoding riboxymes against endogenous RNA transcripts, proteins evoking hypersensitive reactions, and RNA transcripts used for antisense/co- suppression inhibition of gene expression. The polymucleotide sequence contained the vectors prevents the transfer of DNA sequences beyond the T-DNA transgenic This avoids contamination of transgenic plants and/ or transgenic food with vector DNA. Sequences AAXO5690-91 represent primers used for the PCR amplification of the barnase open reading frame. This is used in the construction of a barnase expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides HIV cofactor inhibitors that contain oligonucleotides with a base sequence complementary to the CXCR4 or CCR5 genes. Such inhibitors can be formulated into drug compositions for prevention or treatment of HIV infection, with inhibition of expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of CXCR4 or/and CCR5 gene. Sequences AAZ31244-306 represent antisense oligonucleotides to the CCR5 gene
                                                                                                                                                                                                                                                                  Gaps
certain plants, or those which act on membrane systems and /or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cofactor inhibitors, as drug

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primers AAZ01426-Z06209 were used to amplify open reading frames (CRFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX186754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, allogingis, perimppatitis, bartholinitis, pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases unch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, penetricis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; Inclusion conjunctivitis; genital disease; perhepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

PCR primers AA201426-206209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AA201425). These ORFs encode polypeptides (see AA20142494) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genteal diseases such as nongonococal urecritis, epidymitis, cervicitis, salpiniquis, perihepatitis, batholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Deletion sequence oligonucleotide; sensor array; eukaryotic pathogen; probe; cellular adhesion modulator; cellular proliferation modulator; human retrovirus; human immunodeficiency virus; non-human retrovirus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compositions comprising sensor arrays made up of unique probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique target which is the reverse complement of part of a unique target on longonucleotides present in a mixture of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and hybridize with the probe oligonucleotides of the sensor arrays. Such oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides that are useful for modulating cellular addesion or proliferation, and being active against a enkaryotic pathogen, a human immunodeficiency virus (HIV), or a non-human retrovirus, including infilenza virus, Epstein Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CWV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different specificity of the oligonucleotides in a mixture. Also, if the specificity of the oligonucleotides and may be performed using the secured of the method may be performed using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
oligonucleotides - useful for characterizing a sample of target deletion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          'Match 0.8%; Score 13.8; DB 1; Length 20; Local Similarity 88.2%; Pred. ö AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX1990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent citis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used nucleotides sequences can also be used as immunogenic compositions as vaccines. Vectors containing C. pneumoniae epicope of C. pneumoniae The invention provides a DNA molecule comprising a sequence of mucleotides encoding an alphalF-subunit of a mammalian retinal calcium channel (RCC), including a human and antiha, a murine alphalF-subunit, a murine alphalF-subunit and orthologs of the human and murine alphalF-subunits. The RCC gene may be used to develop products for diagnostic tests, for incomplete CSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, npstagmus and strabismus frequently observed in patients with incomplete CSNB may be caused by calciumtogluicated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for related eye disorders or diseases. Sequences AAZ46520-21 Retinal calcium channel, RCC gene, alphalF-subunit; retinal disorder, myopia, nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human, EST; expressed sequence tag; CSNB; PCR primer; ss. New isolated mammalian retinal calcium channel gene, used to develop products for the diagnosis and treatment of incomplete congenital stationary night blindness and related disorders. AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at postition 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment. N. B. The SEQ ID NOS 2852, 2913, 3054, 3157, 3127, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the

The invention relates to novel serine proteases designated BSSP6

(AABI1712-B11714), and to nucleic acids encoding them (AAA61763-A61765).

The invention also relates to vectors and transformants comprising BSSP6

nucleic acids; transgenic animals in which the expression level of BSSP6

can be varied; and an mBSSP6 knockout mouse. The invention additionally

encompasses anti-BSSP6 antichodies and methods of production of such

antibodies, methods of BSSP6 detection using the antibodies, and the use

of BSSP6 proteins or fragments as diagnostic markers for certain medical

conditions. Nucleotides encoding BSSP6 were initially isolated in a human

brain cDNA library using degenerate PCR primers (AAA6795-A61796) based

on conserved regions of serine proceases. The BSSP6 serine proteases and

nucleotides encoding them are useful in detecting homologues, mutants and

prostate gland, placenta, testis and spleen) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

prostate pland, placenta, testis and spleen) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

prostate pland prostatic hypertrophy. Sequences AAA61768-A61796

represent PCR primers used in the exemplifications of the invention.

Primers AAA61775-A61784 and AAA61795, while primers AAA61764-A61764

A61792 were used to isolate and annulify mutine BSSP6 cDNA (AAA61764).

Primers AAA61768-A61774 were used to construct plasmids used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Serine protease BSSP6, useful in detecting homologs, mutants and polymorphic variants as markers for diagnosis of Alzheimer's disease, epilepsy, cancer, inflammation, infertility and prostate hypertrophy, using blood or other tissues.
                                                                                                                                                                                                                                                                                                       BSSP6; serine protease; human; hBSSP6; mouse; mBSSP6; brain; diagnostic marker; antibody; transgenic animal; Alzhaimer's disease; epilepsy; cancer; inflammation; infertility; pancreatitis; prostatic hypertrophy; PCR primer; ss.

The present invention describes an antisense compound (I) of 8-30 nucleobases, specifically hybridising to, and inhibiting expression of, human jun N-terminal kinase kinase-2 (JKK-2). Also described is a method of inhibiting the expression of human JKK-2 in human cells or tissues, comprising contacting the cells or tissues, with (I), in vitro. (I) has smitinflammatory, cytostatic and antinfectious activities, (I) is useful for inhibiting the expression of JKK-2 in human cells or tissues and prevents or delays infection, inflammation or tumour formation associated with altered expression of JKK-2 in human cells or detecting the levels of JKK-2 in a sample. The present sequence represents a phosphorothicate antisense oligonucleotide for human JKK-2, from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense compound specifically hybridizing and inhibiting the expression of human Jun N-terminal kinase kinase-2 is useful for treating infection,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                per primers AAX89470-x89471 are used to screen a BAC library for the presence of a 14-3-3 sigma nucleotide sequence. 14-3-3 sigma nucleotide sequence. 14-3-3 sigma nucleotide sequence. 14-3-3 sigma nucleotide sequence. 14-3-3 sigma expression is regulated by p53 and exogenous expression of 14-3-3 sigma results in G2 block. The 14-3-3 sigma nucleotide and amino acid sequences are used in the invention to develop agents for the diagnosis, susceptibility determination and treatment of cancer. The amino acid sequence can be used in method for suppressing the growth of tumour centangence and be used for diagnosis, cells. The 14-3-3 sigma polypeptides can mediate cell cycle arrest upon damage to cellular DNA. 14-3-3 sigma probes can be used for diagnosing, testing cancers. They can also be used to treat other proliferative diseases, e.g. psoriasis, polyps, warts, and inflammatory diseases. The proliferation and crouse oligonucleotides can be used for promoting the

The invention relates to 12 novel genomic DNA sequences and proteins which are components of the omega hydroxylase complex of Candida tropicalis ATCC 2036s. The DNA sequences (AAA30566-A3077) respectively encode cytochrome P450 NADPH oxidoreductases CPRA and CPRB (AAV30596, CYPS2ABA, CYPS2AB, CYPS2AB, CYPSZAB, CYPSZAB, CYPSZAB, CYPSZAB, CYPSZAB, CALABA, CALABA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fluids, agricultural chemicals, pharmaceuticals, dyes, surfactants, adhesives and fragrances. The CPR and CYR nucleic acids and proteins enable inexpensive large scale production of industrially useful dicarboxylic acids. Sequences AAA3D522-AD30543 represent QC-RT-PCR primers used in an exemplification of the invention to amplify the Candida tropicalis ATCC20366 CPR, CYP and beta-oxidation POX gene target mRNA.

The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of the humanised anti-human Fas Ig CH11 (see AAA1222-A78212) and the corresponding protein sequences (see AAA12919-1812918 and AAA1202-A78212). And the corresponding protein sequences (see AAA1290-1812910). Also included are anti-human Fas antibody CD peptides (AAA1290-1812910). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78313-A78318 and AAA78331-A78313, while humanised anti-human Ig DNA used in the invention are represented by sequences AAA78377-A78318 and AAA78331. Primer appresented by sequences AAA78377-A78318 and AAA78337. Primer represented by sequences AAA78377-A78318 and AAA78337. Primer represented by sequences AAA78371-A78333 and AAA78337. Primer represented by sequences AAA78337. Primer represented by sequences AAA78371-A78333 and AAA78337. Primer represented by sequences AAA78331-A78331 and AAA78337. Primer represented by sequences AAA783271-A78334 and AAA78337. Primer represented by sequences AAA78331. Primer represented by sequences AAA783271-A78334 and AAA78337. The introduction features Lie infallitication of genes whose expression tereins the cell with the drug of abuse, and comprise contacting the cell with the drug of abuse, and comprise contacting the cell with the drug of abuse, and detecting the expression of one or more of probes that specifically hybridise to the ESTs. The methods are used to identify of apuse, whose expression levels are altered by chronic or acute exposure to one or more drugs of abuse. The identification of genes whose regulation is altered in alcohol tolerance and/or addiction provides a valuable tool to evaluate the response to one or more drugs of abuse. Evaluation of the nature of this response provides information useful in designing to evaluate the response provides information useful in designing to evaluate the response provides information useful in designing to evaluate the response provides information useful in designing to evaluate and recovery regimens, and in evaluating the susceptibility of an organism or patient to drugs in a medical context. Monitoring the expression of identified genes and/or ESTs provides a mechanism by which tesponse of the organism to drugs of abuse. Sequences AAZSS941. Sequences AAZSS951 represent reverse transcriptase-PCR (RT-PCR) primers used to amplify a contal hybridisation probes from SH-SYSY-AH1861 cells in an expression in control and ethanol-treated SH-SYSY-AH1861 cells in an example dever dopamine beta-hydroxylase (DBH) and sodium-dependent corepinephrine transporter (NET). These genes whose expression and ethanol. Primers AAZS9944. and monocyte chemoattractant peptide 1 (MCP-1). These genes are thought to be important targets of ethanol. Primers AAZS9944. and monocyte chemoattractant peptide 1 (MCP-1). These genes are thought to be important beta-hydroxylase (DBH) probe The invention relates the identification of genes whose expression levels

The present invention describes an isolated nucleic acid (I) encoding a mammalian Lhx3. (I) is used in assays to: (I) detect and quantify the presence and level of expression of Lhx3. Lhx3a or Lhx3b, in a sample; (2) identify a compound that affects expression, the level of expression, or the activity of Lhx3, Lhx3a, or Lhx3b in a cell; (3) identify a normonant that affects binding or Lhx3 in a cell; (3) identify a bund of a pituitary trophic hormone gene promoter; (4) identify a human afflicted with a disease, disorder, or condition caused by altered and (5) detect a mutation in a Lhx3 allele in a human. The coding region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 has been shown as P-LIM or LIM-3. The present sequence represents a PCR primer used in the amplification of human Lhx3, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid encoding mammalian Lhx3 for identifying a bwith a disease, disorder, or condition caused by an altered level of expression or binding of Lhx3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dog; genome; genomic marker; radiation hybrid map; identification; chromosome location; gene marker; polymorphic microsatellite marker;

clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3' ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the full length cDNA are useful length clones were obtained by construction of full length enriched cDNA. The full libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA enable the special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                     830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel transport system (A) for molecular substances (I) containing recombinantly prepared subunits (SU) based on amino acids (as) comprising: (i) at least two modified SU with one difference, and/or (ii) one or more modified SU with at least two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transport system for compounds, useful e.g. in gene therapy, comprises mosaic-like assembly of different protein subunits able to encapsulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transport system; gene therapy; infection; tumor; ss; LLO; PCR primer; human immune deficiency virus; hemophilia; muscular dystrophy; capsid; cystic fibrosis; virus-like particle; cell targeting; listeriolysin O.
                                                                                                                                                                                                                                                        The invention relates to primers for synthesising full length cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers for complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be unvolved in genetic diseases
                                                                                                                                                                                                                                                                                                                                                                                                          New radiation hybrid map of the dog, Canine familiaris, genome, useful for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; full length cDNA; cDNA synthesis; oligo-capping; PCR primer; ss.

combined in a mosaic feashon to form (A) in which (I) can be encapsulated. (A) Are used to deliver (I) specifically to cells, particularly DNA to eukaryotic cells for gene therapy, e.g. of infections by human immune deficiency virus; tumors and a wide range of inherited diseases such as hemophilia, muscular dystrophy or cystic fibrosis. Capsids or other virus-like particles can be assembled, simply and in modular feabion, in vitro, allowing control over stoichiometric composition. SU can be modified to impart a wide variety of selected immunogenicity. (A) do not require extensive testing to ensure that they are safe (contrast replication-deficient viruses), also SU can be prepared in very pure form and are easily labeled fluorescently (for quality control or localization). This sequence represents a PCR primer used in the production of a Listeria monocytogenes listeriolysin LO variant which is used to illustrate the method of the invention
(optionally) unmodified SU. The various SU are

(ISIS-) ISIS PHARM INC.

Murray SF, Cowsert LM, WPI; 2001-451899/48. New antisense compound(s) are useful to inhibit a nucleic acid molecule encoding macrophage migration inhibitory factor.

Claim 3; Page 82; 105pp; English.

The invention relates to antisense oligonucleotides 8-30 nucleotides in inhibitory factor (MMIF), where the antisense compound specifically hybridizes with and inhibitors he expression of MMIF. The antisense nucleotides with and inhibits the expression of MMIF. The antisense nucleotides are useful for the treatment of a disease or condition associated with MMIF such as neurological, hormonal, immune, inflammatory or hyperproliferative disorder. Sequences AAH2191-268 represent chimeric antisense phosphorothioate oligonucleotides used for inhibition of human MMIF mRNA expression

```
The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acide acid. The immunostimulatory nucleic acides can be pyrimidine rich (py-tich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae) had over thomyvaviridae), bacterial antigens (e.g. toxophasma, and/or corthomyvaviridae), bacterial antigens (e.g. toxophasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                      Vaccine; cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infections disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccinating against tumors, infectious diseases, allergies and asthma using immunostimulatory Py-rich and TG nucleic acids.

This invention describes novel regulatory sequences (A) derived from human fascin that provide specific expression in dendritic cells (DC) and which have antiviral, antibacterial, antibacatic, anti-
which have antiviral, antibacterial, antiparasitic, anti-
allergic, neurological, immunomodulatory and apoptocic activity. (A) are defensed to regulate expression of antigens, immunoregulators, antisense used to regulate expression of antigens, immunoregulators, antisense cells that contain (A) are useful: (1) in vaccines against viruses, bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-
actoria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-
datoba and Alzheimer's diseases; and (ii) for gene therapy of tumors, allergies, infections, autoimmune diseases and transplant rejection. They can also be provide specific expression of antigens and immunoregulators in DC; for isolation and identification of capecific expression; to determine the degree of maturity of DC and to block transcription factoring binding sites in DC. (A) provide DC-specific expression; con contain and independent control, allowing a more specific expression of nucleic acid under their control, allowing a more specific expression of DC (since a complete leucoycte population may be transformed), including transformation in vitro. This sequence represents a primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.

The present invention relates to a retrovirus of type C morphology, which sediments in a sucrose gradient at a density of 1.16-1.18 g/l. The retrovirus is infectious for canine cells and belongs to the oncovirinae group. The present sequence is a PCR primer for the retrovirus of the present invention. The retrovirus can be included in pharmaceutical compositions or medicaments to treat autoimmune diseases, haematopoietic malignancies or malignant tumours, especially in humans. The retrovirus especially a human
                                                                                                                                                                                                     PCR primer; immunosuppressive; cytostatic; gene therapy; retrovirus; canine; autoimmune disease; haematopoietic malignancy; malignant tumour;

```
The invention provides an agent comprising a pyrone compound or dihydroxy compound of specified formulae given in the specification. The agent is used for correcting gene expression requlation errors. Errors in the following genes may be corrected: Li-6, Li-10, hemeoxygenase-1, prostaglandin G/H synthase-2, macrophage inflammatory protein-1-alpha, inflammatory protein-1-alpha, IL-7 receptor, macrophage inflammatory protein-1-beta, liver and activation-regulated chemokine, macrophage inflammatory protein-2-alpha, growth regulated chemokine, macrophage inflammatory protein-1, marrix metalloproteinase-9, migration inhibitory factor-related protein-1, marrix metalloproteinase-9, migration inhibitory factor-related protein-1, ranskerolase, adenosine AZa receptor, CD7 artigen properdin P factor. regulator of G-protein signaling-2, Nef-associated factor-1, myeloid cluckemia cell differentiation protein-1, signal peptidase complex, and also side-effects caused by them such as inflammation. Sequences AAH76220 contrast and a not the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

PCR primers AAF80165-66 were used to amplify the left-hand GAL7 promoter. The amplified sequence was used to express fusion proteins comprising a heavy chain variable region of an antibody isolated from llama, which was immunised with Malassezia furfur. M. furfur has been implicated in active agent, and used to produce a composition is conjugated to an active agent, and used to produce a composition for topical application, e.g. to the scalp. The topical composition, e.g. hair care products such as shampoos and conditioners, skin care lotions, shower gels, etc., is useful for targeting an active agent to a site at which M. furfur is present for the treatment and prevention of dandruff
                                                                                                                                                                                                                                                                                    Composition for use in targeting active agent, especially antimicrobial agent to scalp for treating, preventing dandruff, has active agent conjugated to antibody capable of binding specifically to Malassezia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha, see AAF57718 for the reference asquence). Polymorlecides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression desirable to decrease or block expression of a particular IL4Ralpha protein isoform, an expression of a patient. In may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human IL4R-alpha New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new. Sequence 20 BP; 3 A; 4 C; 8 G; 5 T; 0 U; 0 Other; Example 1; Page 61; 188pp; English.

Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.

Example 10; Page 149; 520pp; English.

The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The mucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders

cc associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing canactive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids and complementary sequences may also be used as DNA probes in need of sequences in samples and therefore which patients may be in need of sequences in samples and therefore which patients may be in need of reforative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies and activity. The anti-Gene 216 and in assays to identify and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic gents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or ELISA). Disorders that may be consented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present conformation. The primers are used in the physical mapping of the gene (assay) polymorphism (SACP) analysis (ABZ72087-ABZ72184).

their ability to modify the binding of G-protein coupled receptor (GPCR) protein ZAQ and related proteins (human ZAQC, human ZAQT, rat ZAQI (TZAQI), TZAQZ, human and mouse ISE (MISE) receptor, and mouse GPR73) to their ligands (the mature form of human, mouse or rat BVB protein). The receptor protein and ligand are contacted in the presence or absence of the test compound. The compounds are useful in a drug composition for the treatment, and prevention of dispertive and central nervous system (CNS) disportion disorders, including bowel inflammation, diarrhoea, constipation, food absorption disorders, Alzheimer's disease, Parkinson's disease and schizophremia. The present sequence represents a PCR primer used in the Screening of compounds modifying the binding of G-protein coupled receptor protein ZAQ and related proteins to their ligands for use in present invention relates to a screening method for compounds for receptor protein ZAQ and related proteins to the treatment and diagnosis of digestive disorders. Microscopic slide temperature control apparatus for medical diagnosis comprises coupling resistive heating element between the connection pads provided at opposing ends of slide.

Example 3; Col 27; 25pp; English.

The sequence represents PCR primer PV3. The primer was used in the invention to amplify DNA from cells of the stable human cervical cancer cell line SiHa, containing on integrated copy of human papilloma virus (HPV) type 16 per human genome. The invention relates to a novel thermal cycling device for regulating the temperature of a biological sample on filat substrate. The invention also includes an apparatus comprising the flat substrate for use in the thermal cycling device. The invention is

The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in careening for drugs and sweeteners. Recombinant cell lines and transgenic or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 can be detected in a biological companient of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological cample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated polypeptide comprising variant form of mouse or human SACI polypeptide, and is associated with altered preference for carbohydrates or other sweeteners, useful for preventing obesity, diabetes, alcoholism

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of rice lesion formation inhibitor Sp17. The protein improves the heat stress of the plant, and can be used in the development of new breeds of plants for agriculture and horticulture. The present sequence is a PCR primer used to isolate the coding sequence of the invention
useful for medical diagnosis of diseases such as AIDS, also for amplification of nucleic acids in biological samples. The invention has the advantage that it enhances operatively as the heat resisting element is directly coupled to the microscopic slide, and reduces costs as the use of a heat sink is eliminated. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rice-originated gene, Sp17, that inhibits lesion formation and is applicable in improving heat stress of plants thus leading to prevention of lesion formation, for developing new breeds of plants for agriculture and horticulture.

The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding human Talin. Also described. (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition (II) comprising (I) or (a), and (c) inhibiting the expression of human Talin in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antiinflammatory and cytostatic activities, and can be used in antiesness gene therapy and as Talin expression inhibitor. (I) can be used: to prevent or delay infermantion or tumour formation, and in diagnostics, therapeutics prophylaxis, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorothicate coligonic lection, inflammation or tumour formation.

Coligonic lection, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorothicate at the 5' and 3' ends and a 10 nucleotide decoyy gap in the middle, which is used in an example from the present invention
                                                                                  Human, Talin, antimicrobial, antiinflammatory, cytostatic, inhibitor; antisense gene therapy, infection, inflammation, Talin inhibitor; tumour; antisense oligonucleotide; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense compound useful for inhibiting expression of Talin and for preventing or delaying infection, inflammation or tumor formation.
                                                   Human Talin antisense phosphorothioate oligonucleotide SEQ ID NO:77.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 20 BP; 5 A; 7 C; 4 G; 4 T; 0 U; 0 Other;

The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first contenier housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour mestastasis, precancerous lession, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeods; Osler-Webber Syndrome, myocardial angiogenesis plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject. The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disoase involving drug responses, obesity or disorders related to obesity, such as hypernicaemia, digestive pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insulficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker haplotype and a phenotype. Sequences ABK41305 and ABK41328-ABK41331 represent PCK primers used to amplify human LSR gene or USF2 gene biallelic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype.

T. tauschii/wheat D genome microsatellite cfd60 right PCR primer.

Microsatellite marker; wheat; D genome; mapping; genotyping; polymorphism; phenotypic trait; OTL; quantitative trait locus; disease-associated gene; development factor; quality factor; resistence factor; wheat product; identification; detection; genetically modified wheat; PCR; primer; ss.

The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 cauch markers (ARQ9273-ARQ9217). The invention also encompasses the use of left (ARQ92918-ARQ93107) and right (ARQ93103-ARQ93237) primers to amplify and detect the microsatellite markers, and to identify genes a plenotypic trait of interest in wheat. Wheat is an allowatellotd species consisting of 3 diploid genomes designated A. B and of intendent of genome is thought to have been introduced in the constraint of the pecies. The D genome is thought to have been introduced in the most recent intercrossing between the amphipioid AABB and Triticum trauschiif (UD), probably involving only a limited number of genorypes of both species. Due to its polypioid genome, the large size of its genome, and its low level of polymorbing, the genetic mapping of wheat has to dark species. Due to its polypioid genome, the large size of its genome, and its low level of polymorbing, and are very polymorphic in length, between one and six nucleotides long, and are very polymorphic in length, propied sequences of perween one intercontent intercreatellites are codeminant, and exhibit Mandalian in dation, microsatellites are codeminant, and exhibit Mandalian in conservable into show little intraspectes polymorphic than the A or B genome. These microsatellite markers thus help to overcome some of the problems associated which is less polymorphic than the A or B genomes. These microsatellite markers thus help to overcome some of the problems associated with the genetic mapping of wheat. The wheat D genome problems associated primers and associated primers of the invention are useful for identifying genes and associated primers of the interest, most notably Qrus (quantitative trait loci). In particular they may be used for analysing genes and alleles implicated in factors conferring resistant or pathysing development factors; quality factors and factors conferring resistent and assess whether or Map of wheat D genome comprising the genome location of a microsatellite marker, useful for e.g. identifying genes responsible for a desired phenotypic trait, especially quantitative trait loci in wheat, and (INRG) INRA INST NAT RECH AGRONOMIQUE. New NOVX polypeptides and polynucleotides, useful in gene therapy, particularly for treating or preventing cardiomyopathy, atherosclerosis, diabetes, Crohn's disease, hemophilia or cancer in humans. WPI; 2002-508801/54.

Example 2; Page 254; 391pp; English.

The present invention relates to the isolation of novel human proteins referred to as NOVX, and the polynucleotide sequences encoding them. The NOVX proteins of the invention include NOVX-NOVY3 proteins, NOVX auscided and antibodies are useful for treating or preventing a NOVX-associated disorder, or alleviating a pathological state in a subject, atheroscierosis, diabetes, cancer (e.g. adenocarcinoma, lymphoma, prostate cancer, uterus cancer), disorders related to cell signal processing and metabolic pathways, disorders of the neuro-olfactory system (e.g. those induced by trauma, surgery and/or neoplastic disorders), acquired immunodeficiency syndrome (AIDS), inflammatory disorders (e.g. asthma) obesity, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's

The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone metabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptoric pathological conditions. This polynucleotide sequence represents a mouse caspase 6 oligonucleotide relating to the invention.

NOTE: This phosphorothioate oligonucleotide sequence has 2'-MOE wings and
disease), immune disorders, graft versus host disease, Crohn's disease, multiple sclerosis, haemophilia, idiopathic thrombocytopenic purpura, and infectious diseases (e.g. bacterial, fungal, protozoal or viral infections). The polymucleotide sequences are also useful in gene therapy. The present sequence represents a real time quantitative (RTQ)-PCR primer used in NOVX expression studies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Muscular; cytostatic; nootropic; neuroprotective; ophthalmological; antilipaemic; osteopathic; caspase 6; Rieger's syndrome; bone metabolism; ataxia telangiectasia; hyperproliferative disorder; cholesterol disorder; haematopoietic disorder; cancer; neurological; Alzheimer's disease; apoptotic; mouse; murine; ds.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (b) clones of the genomic libraries contained in multiwell plates independent of the marker as edgeded to the mixture to carry out an amplification reaction; (c) a signal oxresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result, and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis, ABL42957 to ABL45322 represent per represent PCR primers for human chromosome and arrayed, The represent PCR primers for human chromosome 21q22.1, which are represent represent por human chromosome 21q22.1, which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; MEKK4 modulation; mitogen-activated protein kinase kinase 4; MTK1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a new antisense compound, comprising 8-30 nucleobases targeted to a nucleic acid molecule encoding human cytohesin-1, specifically hybridises with, and inhibits the expression of, human cytohesin-1, a guanine nucleotide exchange protein for ARP (ADP ribosylation factor). The antisense compound may be used in a pharmaceutical composition for inhibiting the expression of cytohesin-1 in human cells or tissues, and in treating a disease or condition associated with cytohesin-1 by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kite. The present sequence is an antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense oligonucleotide encoding human cytohesin-1, useful for preventing or treating a disease or condition associated with cytohesin-1 expression e.g. tumor or inflammation.

The present invention relates to antisense compounds, compositions and methods for modulating the expression of MEKK4 (also referred as mitogencrivated protein Kinase kinase 4; MAPSK4; MAP FARE Kinase 1; MAP/ERK kinase kinase 4; MAPKKK4; MTK1). The antisense oligos are useful for inhibiting the expression of MEKK4 in cells or tissues. They are also useful for treating an animal having a disease or condition associated with MEKK4 such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human MEKK4 DNA. This sequence is used in the exemplification of the invention Claim 3, Page 92, 132pp, English

The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation of the nucleic acids as compared with a state of methylation of the nucleic acids as compared proliferative disorder of breast tissue is indicative of a cellular proliferative disorder of breast tissue in the subject. The nucleic acids may be TWHST, HOXAS, NBS-1, retinoic acid receptor beta (RAPBERA).

MIN-1 or RASSFIA. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular proliferative disorder, in particular proliferative disorder, in particular proliferative disorder, in particular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma in situ. The present sequence is a primer used in the exemplification of the invention

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are useful for identifying a gene that cells having both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian activity of a gene product, preferably enzymatic activity, carbon cativity of a gene product, preferably enzymatic activity, carbon cativity. The method is useful for identifying a compound having the activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for primer used in the method of the invention. Note: The sequence is that of a proper or primer used in the method of the invention. Note: The sequence as the control of the invention is not represented in the present equence is that of a primer and a sequence is not represented in the primer because the primer because the control of the invention. Note: The sequence is that of a primer and a sequence is not represented in the present and primer because is that of a primer and a sequence is the present and a sequence and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or therapeutic intervention, by inactivating in the strain one allele of gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele by the promoter, so that expression of the second allele is regulated by the promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells having both alleles modified are useful for identifying a gene that cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the cativity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosyntheric, transporter, transcriptional, transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or prolifezation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                  Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

The invention relates to a nucleic acid encoding a adipose (ADP)
polypeptide which requiates, causes or contributes to obesity in an animal or a human. The polynucleotides, proteins, ant-adp antibodies, modulators of adp activity, adp antisense mucleic acids, expression vectors, adp transgenic animals are useful in the diagnosis and treatment of obesity, adiposites, bulimia, wasting (cachexia), eating disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism e.g. Prader-Willi syndrome, laurence-Moon-Biedl syndrome, hypothyroidism, diabetes, Cushing's syndrome, endocrine disorders gastrointestinal diseases, inflammatory bowel disease, ulcerative colitis, and anorexia nervosa. They are also useful for treating disorders of body weight/mass creating inpans, and/or liposarcomas. The compositions are also useful for treating conditions associated with under weight e.g. enhancing or controlling fertility, controlling weight loss in acquired immunodeficiency syndrome (AIDS) or cancer patients. The present sequence is a PCR primer used to amplify an adp nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Adipose protein; se; adp; obesity; transgenic animal; obesity; adipositas; bulimia; wasting; cachexia; eating disorder; blosorder; b

The sequence represents a mouse syndecan-1 reverse transcription PCR primer. The invention relates to a novel use of a Smad3 inhibitor in preparing a medicament to treat or prevent wounds or fibrosis. The invention has antifibrotic and vulnerary activity. The Smad3 inhibitors are useful for preventing fibrosis and improving wound healing. The Smad3 antibodies, as reagents for research purposes, or the identification of other cellular gene products involved in the regulation of fibrosis and improvement of wound healing, as reagents in assays for screening for compounds that can be used in the prevention of fibrosis and improvement of wound healing, and as pharmaceutical reagents in protecting against fibrosis and improving wound healing related to Smad3. Compounds that that Smad3 may be used in inhibiting the activity of wild type and/or mutant Smad3 and in inhibiting the activity of wild type and/or smad3 and in identifying compounds that disrupt normal Smad3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of Smad3 inhibitors in preparing a medicament for treating or preventing wounds or fibrosis, or as reagents in assays for screening compounds for preventing fibrosis and improving of wound healing.

The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, anglogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is human raf

The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CTI), where the compound hybridises and inhibits expression of human CTI. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CTI, e.g. infections, inflammation and tumours, and as research and diagnostic reagents Sequences ABQ66412-ABQ6651 represent chimeric phosphorothoate oligonucleotides, with 2'-WOE wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1 anti-infective; antisense gene therapy; infection; inflammation; tumour; human; ss; inhibitor. The present invention describes a method (M1) for designing capture oligonuclectide probes (1) for use on a support to which complementary oligonuclectide probes (11) will hybridise with little mismatch, where oligonuclectide probes (11) will hybridise with little mismatch, where (1) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and Salents in the same on parasitic infectious agents of special nearty virus and pollo virus, and parasitic infectious agents of selected from Onchoverva volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and fed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the persent oligonucleotide sequences. The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary coligonucleotide probes (II) will hybridise with little mismach, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents c.g. Salmon-lia, listeria monocytogenes and Haemophilus influenza, fungal confectious agents e.g. Crybtococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytorrophis cirus, Epsterin-Barr virus and pollo virus, and parasitic infectious agents calected from Onchoverva volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC method in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is specifically associated with a gene selected from BRCA1 gene, cancer is respected for environmental monitoring, forensics and the food and dentifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. encoded DNAs, for developing drugs to treat diseases of the digestive organs, e.g. colitis, diarrhea, constipation and mal-absorption syndrome. and rat brain-originated G protein-coupled receptor proteins and

Example 5; Page 77; 135pp; Japanese.

The present invention describes human and rat brain-originated G protein-coupled receptor (GPCR) proteins. The GPCR sequences have antidiarrheic and laxarive activities. The GPCR sequences can be used for developing drugs to treat diseases of the digestive organs, e.g. colitis, diarrhoea, constipation and malabsorption syndrome, including gene diagnosis and therapy. The present sequence represents a PCR primer for rat GPCR, which is used in an example from the present invention

Pharmaceutical composition for treating allments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

Claim 15; SEQ ID NO 1512; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a

Page

```
first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent composition of the invention can infillammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, but was obtained in electronic format directly from WIPO cat fip. wipo.int/pub/published_pot_sequences

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 5' or 3' end genomic flanking regions, 6' or 3' end 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinfilalmmatory steroid and ublquinone. A composition of the invention has antinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cust in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antinflammatory steroid in a subject, for reducing levels of adenosine cofficent in a subject stissue, or treating bronchoconstriction, lung surfactant in a subject stissue, or treating bronchoconstriction, lung surfactant in a subject stissue, or treating bronchoconstriction, lote: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat fibs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense, lung dysfunction, nasal airway dysfunction, antiinflammatory steroid, ubiquinone, antiinflammatory, antiallergic, antiinflammatory, antiallergic, antisthmatic, hypotensive, immunosuppressive, cytostatic, gene therapy, antisense gene therapy, respiratory, lung, adenosine sensitivity, adenosine receptor; bronchodilation, bronchoconstriction, lung allergy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gapa

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antisathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cust in antisanse gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung sinflammation, lung allergies, or a respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pot_sequences

The invention relates to a novel pharmaceutical composition, which has

```
first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antinflammatory steroid and ubiquinone. A composition of the invention has antinflammatory, antiallergic, antisthmatic, hypotensive, immunosuppressive, antiallergic, antisthmatic, hypotensive, immunosuppressive, antiallergic, antisthmatic, hypotensive, creventing a respiratory, lung or malignant disease or condition, also preventing a respiratory, lung or malignant creppiratory effect of an antial ammatory steroid in a subject, for reducing levels of adenosine receptor, producing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, broducing bronchodilation, increasing levels of adenosine receptor, broducing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung albergies, or a respiratory disease or condition. Note: The sequence data for this patent is not respresented in the printed specification, but was obtained in electronic format directly from WIPO at fig.

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an initial ammatory steroid and ubiquinon. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition, is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antistral ammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactent in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed of specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ftp.wipo.int/pub/published_pct_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 992; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a

```
first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

The present invention relates to the isolation of a human retinal pigmented epithelium derived neurotrophic factor (FBDF), and polymucleotide sequences encoding it. The gene encoding human PEDF maps to chromosome 17p13.1-pter. The invention also describes a truncated version of PEDF referred to as PEDF-BH, vectors comprising nucleic acids encoding PEDF or PEDF-BH, and a method of using these sequences to treat retinal diseases such as retinal tumours (e.g. retinoblastoma), neuronal-retinal tumours, macular degeneration, retinitis pigmentosa, retinal detachment, diabetic retinopathy, inherited and age-related pathologies, tumours, ocular diseases, nerve injuries, and conditions resulting from the activity of serine proceases. The present sequence represents a PCR primer used to isolate human PEDF genomic clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method (M) for generating a substantially homogeneous population of undifferentiated cells (UC) from a biological sample (BS), which comprises subjecting BS or its sub-sample to tissue-disruption to provide a mixed population (MP) comprising UC, subjecting MP to a cell size-discrimination (SP) step, and simultaneously or sequentially with SD, subjecting the cell population obtained to a cell-surface marker-discrimination step. prepared by (M); (2) a composition (II) for use in cell replacement therapy, comprising a population of substantially homogeneous population of neural stem cells (NSCB) generated by (M); and (3) a composition (III) comprising a growth factor identified using a homogeneous population of NSCB generated by (M). (I) can have nootropic, neuroprotective and neighborkinsonian activities, and can be used in gene therapy. (M) is useful for generating a substantially homogeneous population of undifferentiated cells such as NSCB from a biological sample, and is useful for the replacement of neural tissue in a naimal.

(II) is useful in cell replacement therapy in an organ such as the brain or in the nervous system, preferably central nervous system (CNS), for treating a CNS disorder such as Alzheimer's disease, Parkinson's disease, centre brain injury and CNS dysfunction. (I) is useful for the repair or regeneration of tissue. ABZ80278 to ABZ80363 represent PCR primers which are used in an example from the present invention for markers defining

which is targeted to mRNA encoding human c-raf, a rraf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, required the mRNA encoding human c-raf, a rraf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, required the required required in language of included is a composition comprising the oligonucleotide and a pharmaceutically acceptable carrier. The antisense oligonucleotide is useful for inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a chemotherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition such as cancer, angiogenesis or neovascularisation. The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in various cell functions and physiological processes and conditions and for diagnosing conditions associated with raf expression and for research purposes. The present sequence is an antisense oligonucleotide included in the sequence listing but not mentioned elsewhere in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adenosine triphosphate (ATP)-binding cassette transporter subfamily C12;
                                                        invention relates to an oligonucleotide 8-50 nucleotides in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cystic fibrosis transmembrane conductance regulator; human; CFTR/MRP; multidrug resistance-like subgroup; somatic gene therapy; ABCC12; paroxysmal kinesigenic choreoathetosis; cysteinyl leukotriene; anionic drug; methotrexate; neutral drug; glutathione; glucuronate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 13.8; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                          The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region of a nucleic acid molecule encoding human interleukin 12 p40 subunit. The compound specifically hybridises with one of the regions and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human Interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues in vitro with the compound, so that antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in animals and humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
New antisense chimeric oligonucleotide, useful for modulating the expression of human Interleukin 12 p40 subunit, in treating or preventing disease states in humans and animals, and as research reagents and

This invention describes a novel human ABCC12 (adenosine triphosphate (ATP) binding cassette transporter gene subfamily C12, i.e. cystic fibrosis transmembrane conductance regulator/multidung resistance-like subgroup (CFTR/MRP) family) polypeptide and its encoding polymucleotides ABCC12 polypeptide is useful for screening agonists and antagonist of the ABCC12 polypeptide. The products of the invention are useful for screening and active ingredient for preventing and treating paroxysmal screening an active ingredient for preventing and treating paroxysmal kinesport of organic anion transporters such as cysteinyl leukotriene, anionic drugs, such as methotrexate, neutral drugs conjugated to acidic ligands, such as glucathione, glucuromate or suphate conjugated drugs and can be used for somatic gene therapy. This sequence represents a region corresponding to an exon/intron boundary from the gene encoding a human ABCC12 isoform described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, mouse, 88; primer, gene 216; antiasthmatic, antiinflammatory, anorectic; chromosome 20p13-p12; single nucleotide polymorphism; SNP; gene therapy, respiratory disease; asthma; obesity; PCR; bronchial hyper-responsiveness; chronic obstructive pulmonary disease; adult respiratory distress syndrome; inflammatory bowel syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated gene 216 nucleic acids, useful for diagnosing, preventing treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human gene 216 polymorphism detection PCR primer #32.

Novel compound targeted to a nucleic acid molecule encoding fibroblast

```
The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known ser PGFR-3, ACH, JUYK4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or by-perpoilerative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

A method and a kit for determination of expression of mRNA or cDNA of protein participating in the maintenance of skin structure.

Claim 1; Page 2; 34pp; Japanese.

The present invention describes a method and a kit for determining the expression of mRNA or cDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAWC2, matrix metalloproteinases MMP-1, MMP-2, MMP-3 and MMP-9, VII collagen, type I collagen alpha 1 chain, type IV collagen alpha 1 chain, ACF57290 represent PCR primers and probes used in the method of the

invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of an antisense primer for Fas-associated protein with death domain (FADD). Use with the sense primer given in ACPOSTAS generates a 695 bp product. Semi-quantitative RT-PCR was used to determine levels of FADD RNA in thyroids of gen transgenic mice during various stages of tumour development. These mice provide models of human. Approved tumours. FADD expression was shown to decrease, in some cases to zero, during tumour development. It therefore provides a marker for the absence of in vivo tumour. FADD proteins are secreted from tumour cells. A low cellular amount and a high extracellular amount of FADD proteins are prognostic of resistance to chemcherapy. The invention provides methods for determining a status of tumour absence/presence, and for prognosis of the resistance of a tumour to chemotherapy on the basis of

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                 ;

The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /mod_base= OTHER

The invention relates to a compound 8-50 mucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound of specifically hybridises with the nucleic acid molecule encoding complement component C3 and inhibits the expression of complement component C3 and inhibits the expression of complement component C3. Also included are a composition comprising the expression of a pharmaceutical carrier or diluent, inhibiting the expression of complement compound cited above) and treating an animal camplement component C3 in cells or tissues (complement component C3 in cells or tissues (complement component C3 complement component C3 in complement component C3 in complement component C3 in complement component C3 is inhibiting the expression of complement component C3 is inhibiting the expression of complement component C3 is inhibiting an animal having a disease or condition associated with complement component C3 such as an autoimmune disorder (e.g. multiple sclerosis), an infection, or atherosclerosis, inflammation, septic shock, multiple organ failure, or useful as research reagents and diagnostics, in distinguishing functions continue members of a biological pathway, or for preventing or delaying intervance organ failure and complements of a various members of a biological pathway, or for preventing or delaying an entire component C3 in the present sequence is an entired and entire component C3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antisense; ss; human; eukaryotic translation initiation factor 2C 1; EIF2C1; Co-EIF2C; Golgi ER protein 95kDa; GERp95; Q99; gene therapy; hyperproliferative disorder; familial hypercholesterolaemia; cancer; polycystic kidney disease; cystic fibrosis; progeriod syndrome; cytostatic; antilipaemic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                                                                                                                                                                                                                     This invention relates to novel antisense oligonucleotides that modulate the expression of human eukaryotic translation initiation factor 2C 1 (EIF2C1). EIF2C1 is located on chromosome 1934-35, and is also known as Co-eIF2C, eIF2C1 Golgi Ex protein 95kDa, GER995 and 199. It is an intracellular membrane associated protein thought to be involved in cellular differentiation, such that altered expression of EIF2C1 can affect cell growth, morphology and tumourigenicity. Accordingly, antisense oligonucleotides that inhibit the expression of EIF2C1 in cells including hyperproliferative disorders, damilial hypercholesterolaemia and cancer, as well as polycystic kidney disease, cystic fibrosis and progeriod syndrome. As such, the oligos of the present invention can be described as having cytostatic and antilipaemic activities. This oligonucleotide sequence is an antisense oligo used to inhibit expression of the human eukaryotic translation initiation factor 2C 1 (EIF2C1) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                    New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating hypercholesterolemia or hyperproliferative disorder, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, ss; PCR; retinal pigment epithelial-derived neurotrophic factor; PEDF; tumour, ocular disease; neuronal cell pathology; serine protease; blood coagulation; thrombosis; bacterial infection; parasitic infection; elastosis; vascular disorder; fibrinoid formation; coagulation disorder; arteriosclerosis; ischaemia; arthroses diabetes; emphysema; arthritis;

The invention relates to a composition comprising purified retinal comprisions comprise ADB99089, ADB99080 requested neurotrophic factor (PEDF). The PEDF controlled are professed comprises ADB99089, Human PEDF is encoded by ADB99088 Also included are purifying PEDF, producing PEDF comprising expressing the DNA sequence concomplinate DNA molecule comprising a comprising a PEDF in a host cell, a recombinant DNA molecule comprising a peope, a recombinant DNA molecule comprising a retinal PEDF CDNA, a host cell containing the vector, a recombinant DNA molecule comprising a retinal PEDF CDNA, a host cell containing the vector, a recombinantly produced PEDF protein siolated or is free from the risks normally associated with proteins isolated or continued a naturally occurring source organism and a purified human cell containing the vector, colar disease, neuronal cell pathologies, or conditions resulting from the activity of serine proteases, escing parasitic infection, colared proteins isolated retinal infection, parasitic infection, alastosis, vascular disorders involving fibrinoid formation, coagulation disorders, arteriosclerosis, isohemmia, arthrise septic shock, lung diseases, excessive complement activation, ulcers, ulcerative colitis, pancreatitis, fibrinolytic disease, arthropathy, bone resorption, proteases, the present sequence is a PCR primer used to isolate genomic DNA encoding human retinal pigmented epithelium derived repitment used to isolate genomic CDNA encoding human retinal pigmented epithelium derived repitment used to isolate genomic CDNA encoding human retinal pigmented epithelium derived repitment used to isolate genomic CDNA encoding human retinal pigmented epithelium derived repitment used to isolate genomic CDNA encoding human retinal pigmented epithelium derived repitmented epithelium derived preciped to the preciped to the preciped to the preciped to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New purified retinal pigmented epithelium derived neurotrophic factor composition, useful for treating tumors, i.e. retinal tumor, ocular disease, neuronal cell pathologies, coagulation disorders or arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gabs
septic shock, lung disease; complement activation; ulcer; ulcerative colitis; pancreatitis; psoriasis; fibrinolytic disease; arthropathy; bone resorption; hypertension; congestive heart failure; cirrhosis; protease allergy; chromosome 17p13.1-pter; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tombran-Tink J, Steele FR, Chader GJ, Becerra SP, Johnson LV;

```
The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence represents a 2'-C-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to human TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for trating hyperproliferative disorder e.g., lung, liver, colon or gastric cancer.
                                                                                                                                                 human; antisense oligonuclectide;
transforming growth factor beta receptor II; TGF-beta receptor II;

proteins (II) from Lollum perenne and Feetuca arundinacea which are active in lighth, fructan and tannih blosynthetic pathways. Also described (1) an isolated oligonucleotide probe or primer comprising at least 10 contiguous residues complementary to 10 contiguous residues of (I); (2) a kit comprising the oligonucleotide probe or primer; (3) a genetic construct comprising (I); (4) a transgenic plant cell comprising the genetic construct of (3); (5) a plant or its seed, fruit or progeny comprising the transgenic plant cell of (4); (6) modulating one or more of the lighin, fructan or tannih compositions; and (8) modifying the activity of (II) involved in a lighin, fructan or tannih compositions; tannih blosynthetic pathway in a plant. (1) can be used for modulating the blosynthesis of lighin, fructan or tannih in a plant. The present sequence is used in the exemplification of the present invention.

New polynucleotide encoding polypeptides from Lolium perenne or Festuca arundinacea, useful for modulating the biosynthesis of lignin, fructan or tannin in a plant.

```

The invention relates to a compound (antisense oligomuclectide) hybridising with the eighth nucleobase portion of an active site on a nucleic acid molecule encoding CDB1 (also known as TMpA-1, a tetraspanin) and inhibiting the expression of CDB1. Also included is a composition comprising the antisense oligomuclectide and a carrier or a diluent. The antisense oligomuclectide in useful for inhibiting the expression of CDB1 in cells or tissues. The antisense oligomuclectide is useful for intracting infections preferably viral, bacterial and parasitic and disease or condition is characterised by chemical dependency (e.g. cocaine addiction). The present sequence is a CDB1 antisense oligonuclectide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detector for identifying human papilloma virus subtypes, comprises carrier having two parts carrying first and second oligonucleotides that respectively hybridize with DNA contained in first and second subtypes of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Human papillomavirus type

EP1302550-A1

```
The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.

Angiogenesis inhibitors for treatment and prevention of diseases and inflammatory disease.

```
The invention relates to a novel angiogenesis inhibitor comprising a compound that inhibits the activity of an amino acid sequence given in the specification. Angiogenesis-related proteins Bv8, ZAQ and 15E were utilised within the method of the invention. The molecules of the invention demonstrate cytostatic and antiinflammatory activities whilst the method may be useful for treatment and prevention of cancer, ovarian diseases, diabetic retinopathy and inflammatory disease. The current sequence is that of the angiogenesis inhibitor-related PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Investigating male genetic infertility, useful for diagnosis e.g. for assessing sultabilty for in vitro fertilization, based on multifactorial analysis of infertility-related mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for investigating genetic infertility or predisposition in males. The method involves selecting at least two infertility-associated mutations which are recessive or intermediate that are associated with infertility in the heterozygous state and/or only in the homozygous state. Preferably at least one azoospermia factor is detected which may be lost by microdeletions intervals 5 or 6 of the Y-chromosome. Also any of several hundred mutations, listed, present in the cystic fibrosis transmembrane conductance regulator (CTFR), Kallmann syndrome (KAL1), androgen resistance (AR) or steroid 21-hydroxylase (CYP21) genes may be detected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         primer, male infertility; infertility-associated mutation; azoospermia factor; Y-chromosome; cystic fibrosis transmembrane conductance regulator; CTFR; Kallimann syndrome; KALI; androgen resistance; steroid 21-hydroxylase; CYP21; microarray; quantitative trait locus; in vitro fertilization; oligospermia; ss.

31-OCT-2002; 2002US-040533P. (CURA-) CURAGEN CORP. WPI; 2003-441555/41. Probes for the mutated genes and/or native nucleic acid, or their complementary strands, are fixed to a carrier, particularly as a microarray, then tested for hybridization with oligomortectides from or synthesized from, a patient sample and hybridization detected.

Multifactorial analysis is by standard statistical methods, particularly the quantitative trait locus method. The method is used to diagnose inherited male infertility or predisposition to its, especially in conjunction with in vitro fertilization programs, e.g. for assessing intracytoplasmic sperm injection method. Analysis of many mutations intracytoplasmic sperm injection method. Analysis of many mutations improves diagnosis of the genetic basis of male infertility, including polygonic origins (complex interactions between different heterozogotic mutations). A chip for analyzing genetic infertility in males comprises coligomuclectides that represent known mutations (nonsense or missence, insertions, allelic variants deletions or rearrangements) in the cystic fibrosis transmembrane conductance regulator, Kallmann syndrome, androgen resistance and steroid 21-hydroxylase genes. ADD42140-ADD42633 represent coligonucleotides used in the microarray described in the method of the invention. NOTE: there are no SEQ ID's 133, 472 or 473 represented in the ö

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antitarteriosolerotic, virucide, antiparkinsonian, indicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory demanded, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory for demanded and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diseases including hypertension and atheroscierosis, cardiovascular diseases including hypertension and atheroscierosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's disorders, inflammatory skin disorders, asthma and dyslipidaemia.

Furthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopolesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of interior and proliferation and proliferation and promoses and the current sequence is that of interior. invention

```
The invention relates to an isolated CPRA, CPRE, CYP52A1A, CYP52A2A,

CYP52A2B, CYP52A3A, CYP52A3B, CYP52A5A, CYP52A5B, CYP52A2B, CYP52A2B,

CYP52A4B, CYP52A4B, CYP6Atrome P450, CPR - NADPH reductase) of the

CYP52A4A protein (CYP - CYCOKIONOME P450, CPR - NADPH reductase) of the

Candida tropicalis owega-hydroxylase complex. Also included are the

nucleic aids encoding the CYP/CPR proteins (including their coding

regions), a vector comprising the nucleotide acid, a host cell

transfected or transformed with the vector, discriminating members of a

gene family by quantifying the amount of target mRNA in a sample and

increasing production of a dicarboxylic acid (comprising: providing a

host cell having a naturally occurring CPR/CPP proceed and culturing the

constant of a dicarboxylic acid (comprising). The CYP and

constant in media containing an organic substrate which upregulates the

cens, to effect increased production of dicarboxylic acid). The CYP and

cPR proteins, present in higher levels than normal is useful for

increasing production of dicarboxylic acids. The present sequence is a

cuantitative competitive reverse transcriptase PCR (QC-RT PCR) primer

used to assay the levels of CYP/CPR mRNA in RNA samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated CPRA, CPRE, CYP52A1A, CYP52A2A, CYP52A2B, CYP52A3A, CYP52A3B, CYP52A5B, CYP52A5B, CYP52A5B, CYP52A6B or CYP52D4A protein, useful for increasing production of dicarboxylic acid in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cornett
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.8%; Score 13.8; DB 1; Length 20;

Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.

(TOKU) TOKUYAMA SODA KK WPI; 1992-263663/32. Disclosure, Page 64; 66pp; Japanese.

X4X4X44X2X2X2XXXX

The sequences given in AAQ27030-77 are primers. These were used to amplify the claimed hepatitis C virus genes of the invention which could then be inserted into an E. coli vector. The polypeptides encoded by the vectors were useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods

The sequences given in AAT00282-394 represent DNA ligands to basic fibroblast growth factor (bFGF). These sequences were isolated using the primers and target regions given in AAG98421-29 using systematic primers and target regions given in AAG98421-29 using systematic containing a region of 30 or 40 random nucleotides flanked by constant containing a region of 30 or 40 random nucleotides flanked by constant containing a region of 30 or 40 random nucleotides flanked by constant containing a regions, were synthesized. The consent regions were designed to be amplified by the primers. The primer 3p7.1PS has 2 biotin phosphoramidites and two additional A residues covalently attached to its containing an equimolar mixture of the four nucleotides during synthesis. The random regions were created by uncleotide synthesis. Three pools of sspNNA were created that contain incleotide synthesis. Three pools of ssDNA were created that contain incleotide single stranded DNA (ssDNA) was then amplified by PCR. A selected single stranded DNA (ssDNA) was then amplified by PCR. A significant improvement in affinity of BNA liquads was seen after 10 counds of selection. Five distinct families of ssDNA were identified, based on regions of homology. Some sequences showed no obvious homology to the five families and are considered to be orphans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identification of ligands to basic fibroblast growth factor and thrombin - which can be modified for increased in vivo stability.
                                                                                                                                            Family 1; family 2; ligand; thrombin; systematic evolution of ligands by exponential enrichment; SELEX; heparin; selection; region of homology; inhibitor; ss.

The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT4608-T44693 are esp. used to detect HPV types 26, 31, 31B, 35, 39, 40, 43, 45, 51-59 and 68 The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT4733-T4906, which are based on and amplify fragments of the L1, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prodes is done with probes derived from consensus sequences found in all characterised HPV sequences. Probes AAT4762-810 are examples of HPV typing probes for identifying the amplified products generated by L1 consensus primers. This sequence is a sense probe which has specificity for HPV6 and binds to the HPV genome at position 6813. (Updated on 25-MAR-2003 to correct PF
                                           Nucleic acid hybridisation probes - specific for selected human papilloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligo:nucleotide probes for human papilloma-virus - used for detecting and typing HPV and for detecting previously unknown HPV types and subtypes.

The sequence is that of a PCR primer plas which was used in the isolation of DNA encoding a major subunit of the Duffy blood group antigenic system, the gp-Fy proteins. The gp-Fy proteins are gp-Fy alpha and gp-Fy beta which are produced from the same gene via a mRNA splicing mechanism. It contains the major receptor by which Plasmodium viava enters red blood cells (RBC) and causes malaria. The proteins are thus useful in preventing malaria and in regulating RBC, renal and neural function. The protein or certain fragments of it, may also be used to generate antibodies, complementary peptides and drugs modelled on their terriary structure, useful in the same way
                               The present sequence is a human papillomavirus 6 (HPV6) specific typing probe. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid encoding gp-Fy, Duffy antigen proteins - used to prevent vivax malaria and to regulate erythrocyte, neural or renal function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gp-FY protein; Fyb71-81; duffy blood group; antigen; alpha; beta;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a human papillomavirus (HPV) L1 type-specific probe of the invention. This sequence may be used in conjuncture with L1 specific primers for detecting and typing HPV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is a PCR primer for the gene encoding the prostate specific antigen, and were used in the method of the invention. The method is for identifying markers for a disease state, and comprises: (a) providing a clirst set of peripheral blood mRNAs from one or more normal subjects known to exhibit the disease state and a second set of peripheral blood mRNAs from one or more normal subjects to fmRNAs trom one or more normal subjects of mRNAs to provide nucleic acid amplification products; (c) comparing the sets of mRNAs to provide nucleic acid amplification products; (c) comparing the sets of an expectation products; (d) dentifying those mRNAs that are differentially expressed between normal subjects and subjects exhibiting the disease state; where a difference in quantity of expression of an mRNA is indicative of a difference in quantity of expression of an mathod of detecting a metastatic cancer disease state, any be detected, diagnosed, or a prognosts may be delivered by examining a blood sample rather than relying on a more invasive, or less state may be detected, diagnosed, or a prognosts may be delivered by examining a blood sample rather than relying on a more invasive, or less progression, status and response to therapies through monitoring of differentially expressed disease markers. The methods can be used for disease such as cancer (especially metastatic or prostate cancer), asthma. lupus erythematosus, rheumatoid arthritis, multiple sclerosis, interstitial cystitis, prostatis or other systemic or chronic conditions interstitial cystitis, prostatis or other systemic or chronic conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Primers hTSCex19 forward and reverse (see AAV40603 and AAV40604, respectively) are designed to amplify exon 19 of the human hTSC gene (see AAV40661) that codes for thiaride-sensitive Na-Cl cotransporter TSC (see AAV20682). Both primers are located within introns of hTSC. 27 Sets of specific primers (see AAV40658) were used for SSCP analysis of hTSC. Amplified products were analysed for molecular variants by electrophorosis; and identified variants were sequenced. Complete linkage of Gitelman's syndrome with TSC was demonstrated. Identification of the molecular basis of Gitelman's syndrome allows for the genetic diagnosis of this disorder. The invention provides products and methods useful for diagnosis and treatment of Gitelman's syndrome and other ion transport
Thiazide sensitive cotransporter and ATP sensitive potassium channel genes - useful for developing products for the diagnosis and treatment of ion transport disorders, e.g. Gitelman's Syndrome or Bartter's Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polymorphism; human; inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; disgnosls; prevention atherosclerotic plaque; premalignant metaplastic lesion; endomerriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene present in a population and targets only one allelic forms methods can be normal somatic cells, and the first gene. The products and methods can be normal somatic cells, and the first gene. The products and methods can be caucers, atherosolerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and malignant cells from bone marrow transplants. AAZSSB12-ZSB825 represent human polymorphic sites described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 14; Fig 1; 605pp; English.

```

This invention describes novel thrombogenic polypeptides which comprise a thrombogenic substructure and a context-dependent entity which recognizes desired biologically susceptible sites, e.g. tumour vascular endothelium. A novel context-dependent functional entity comprises a substructure with having the ability to recognize desired biologically susceptible sites, where the entity imparts thrombogenic activity when positioned in the function-forming-context at the biologically susceptible sites, and the pritty has no thrombogenic activity absent a function-forming-context at the biologically susceptible sites, the context-dependent functional entities impart thrombogenic activity only at biologically susceptible sites. The context-dependent functional entities impart thrombogenic activity only at biologically susceptible sites. The context-dependent functional sites. They can be used to obliterate vasculative malformations or to selectively thrombose the vasculature of solid tumours. This sequence represents a human plasminogen FCR primer used in the method of the

New ABC1 polypeptide is useful for treating diseases associated with ABC1 biological activity, e.g. Alzheimer's disease, Huntington's disease and cancer.

Example; Fig 11; 229pp; English.

The invention relates to the human ABC1 cholesterol transporter protein

(B38082) and to modeld acid sequences (C69120) which encoded it. ABC1 is
a member of the ATP-binding cassette (ABC transporter) superfamily of
a member of the ATP-binding cassette (ABC transporter) representations, and plays a crucial role in cholesterol transport, particularly
intracellular cholesterol trafficking in monocytes and fibroblasts, being
involved in cholesterol trafficking in monocytes and fibroblasts, being
conversed in cholesterol trafficking in monocytes and fibroblasts,
conversed on chromosome 9q31, and mutations in this gene are associated
with two genetic PHD (High density lipoprotein) deficiency disorders,
conversed density choromary are an autosomal recessive disorder,
and in the blood correlate with a high risk of cardiovascular
disease, particularly occomary artery disease, but also cerebrovascular
disease, particularly coromary artery disease, but also cerebrovascular
disease, coromary restences of HDL has protective effects against
conversely, a high level of HDL has protective effects against
conversely, and methods of gene therapy for the treatment or prevention of
cardiovascular disease. The invention provides genetic constructs and
correlavascular disease compunishing the administration of an expression
cardiovascular disease compunishing the administration of an expression
certainvascular disease compunishing the administration of an expression
certachovascular disease, coronary are coronary artery disease,

CC Rappa3 opioid receptor (muopioid receptor-1, KOR-3). The specification describes four new axons of the KOR-3 gene, which combine to yield seven new KOR-3 splice variants of human, mouse and rat origin. These splice variants of human, mouse and rat origin. These splice variants are potential targets for modulating morphine analgesia and opioid-mediated ingestive responses. The KOR-3 polypeptide are used to opioid-mediated ingestive responses. The KOR-3 polypeptide are used to coreen compounds for opioid activity. Such compounds are potential analgesics or more generally agents that affect gastrointestinal core normality, respiration or the immune, andorime or autonomous nervous systems, e.g. regulators of parisalsis. Antagonists, agonists and ligands of KOR-3, as well as DNA vectors expressing KOR-3-encoding conclica caids, or sequences antisense to KOR-3 nucleic acids, are used to regulate morphine analgesia and body weight. The level of KOR-3 or tissue distribution of KOR-3 can be measured to diagnose KOR-3 related particularly controled disorders. Transgenic animals with extra copies of the KOR-3 gene, or with endogenous alleles deleted, are used to study loss or gain of function phenotypes New splice variants of the kappa-opioid receptor, useful in screening for selective analgesics and for regulating morphine analgesia or body Sequence 21 BP; 4 A; 7 C; 6 G; 4 T; 0 U; 0 Other; KETTERING INST CANCER RES Example 1; Page 30; 61pp; English 99WO-US015977 98US-0093002P Pan Y; WPI; 2000-182421/16. AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haphotyphag studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3086, 3157, 3227, 3297 and 3037, are not actually given a sequence in the Sequence Listing from the
